

Imaging MacOS X

Karl Kuehn - Lead developer InstaDMG

MacSysAdmin Conference 2009

Introduction

Presentation Overview

- ▶ Imaging Concepts
 - ▶ Available Systems
 - ▶ Important Tools
 - ▶ Choosing your path
 - ▶ Tips & Tricks
-
- ▶ More InstaDMG (time allowing)

Introduction

What I will not cover

- ▶ Windows Imaging
- ▶ Multi-volume imaging (nothing handles it well)
- ▶ Computer Maintenance (post imaging)

Imaging Concepts

An introduction to system imaging

Imaging Concepts

What is system imaging

- ▶ *Take the setup work for one computer and apply it to others*

Imaging Concepts

What is system imaging

- ▶ *Take the setup work for one computer and apply it to others*

Imaging Concepts

What is system imaging

- ▶ *Take the setup work for one computer and apply it to others*

Applications

Imaging Concepts

What is system imaging

- *Take the setup work for one computer and apply it to others*

Applications

Settings and Preferences

Imaging Concepts

Imaging Concepts

What is system imaging

- *Take the setup work for one computer and apply it to others*

Imaging Concepts

What is system imaging

- *Take the setup work for one computer and apply it to others*

Imaging Concepts

Image Files

- ▶ Apple's .dmg format is the standard on MacOS
- ▶ Encapsulates one or more filesystems
 - ▶ In practice just one
- ▶ Typically replaces entire volume - “Monolithic Image”
- ▶ Can also be used to replace specific files (much slower)
- ▶ Capture or restore can be block-level or file-by-file

Imaging Concepts

Image Files

Block Create

- ▶ Copies disk exactly
- ▶ Image any format
- ▶ Faster capture/restore

Block Restore

- ▶ Much faster (10x +)
- ▶ Wipes out disk first

File-by-File Create

- ▶ New pristine image
- ▶ Makes native format
- ▶ Avoid disk corruption

File-by-File Restore (copy)

- ▶ Essentially file copy
- ▶ Replaces individual files

Why Image

- ▶ *“Laziness: The quality that makes you go to great effort to reduce overall energy expenditure.”*

Larry Wall, Programming Perl

- ▶ Trade up-front setup time for less time per-computer
- ▶ Three types of time:
 - wall time, your time, computer time
- ▶ Indispensable in some setups, impractical for others

When to Image

Good Situations

- ▶ Initial deployment
- ▶ Tightly controlled systems
 - ▶ Computer Labs
 - ▶ Testing Labs
- ▶ Nuke 'n Pave
- ▶ Don't care about the data

Bad Situations

- ▶ Every computer is unique
- Software & Hardware
- ▶ Users are local admins
 - ▶ Lots of local changes
 - ▶ Computer based licenses

Applying the image

Golden Computer

Applying the image

Golden Computer

Applying the image

Golden Computer

Applying the image

- ▶ Small step from retail experience
- ▶ Much faster to restore than install (10 min. vs. 45 min.)
- ▶ Little setup or hardware required
- ▶ Very manual, does not scale
- ▶ There are some problems... (later)
- ▶ How do you update the image? Clean or Dirty?

MegaPackage

An alternate route

- ▶ Wrap up your work in neat bundles, and let the computer repeat it the same way every time
- ▶ Learn to create packages, it is really, really worth it
- ▶ Wrap all of your packages in a single meta-package:
A one (... err.. few) click install of your settings and apps
- ▶ Apply this to a new computer, to update an in-the-field computer, or as a troubleshooting step

Packaging

- ▶ Learn to create packages
- ▶ Many tools available:

PackageMaker

Iceberg

JAMF Composer

InstallEase

- ▶ Useable in so many different parts of a workflow
- ▶ Think of packages as a bank where you store your time
- ▶ If you invest early, then you get rewarded by interest
- ▶ More than worth the effort and learning curve

System Image Utility

Leopard Version

- ▶ Comes with Server Admin Tools (free download)
- ▶ Creates NetBoot (.nbi) sets from your setup
 - ▶ NetBoot clients
 - ▶ NetInstall
 - ▶ NetInstall Block restore - (NetRestore)
- ▶ Workflow items to add users, packages, etc...

System Image Utility

Leopard Version

System Image Utility

Leopard Version

- ▶ NetBoot makes it easier to scale/delegate
- ▶ Some automation is possible
- ▶ NetInstall is slower to install, but possibly safer
- ▶ Block restore is much faster, and can take your images
- ▶ Both can have additional packages/settings
 - ▶ No support for computer-by-computer choices

Bombich NetRestore

The retired champ

- ▶ *Probably most used restore technique - the basis of comparison*
- ▶ *Has been withdrawn*
- ▶ *A tool for creating and deploying ASR images*
- ▶ *Evolved from a tools disk item*
- ▶ *Creates .nbi sets from booted computer*
 - ▶ *.nbi is a good tools disk setup*
- ▶ *Can be automated or scripted, but a lot of custom development*

Bombich NetRestore

The retired champ

- ▶ Allowed for portable drives or netboot
- ▶ User could choose the image and the target
- ▶ Auto-configuration with PHP (extra setup)
- ▶ Central admins could delegate to others
- ▶ Can even use ASR broadcasting

DeployStudio Server

The new kid on the block

- ▶ The anointed inheritor to NetRestore
- ▶ Everything is handled with a workflow full of items:
Packages, Binding, Naming, etc..
- ▶ Packages can be installed during first boot
- ▶ Many decisions can be automated, or deferred to console

DeployStudio Server

The new kid on the block

Dirty Images

- ▶ Trashes, Caches, /tmp, Kernel Caches
- ▶ Leftover downloads, Browser history, etc...
- ▶ First boot configuration
 - ▶ Sets up the network ports and hostname
 - ▶ Setup Local KDC (weird effects in Bonjour iChat)
 - ▶ SSH host keys
 - ▶ And a lot more...

Dirty Images

Greg Neagle's cleanup script

```
#!/bin/sh
#this script does some cleanup in preperation for building an image
#best to run this from single user mode, or at least right before you shutdown
#run this as root, or with sudo rights
```

```
#set machine names back to generic
/usr/sbin/scutil --set ComputerName "OSX_Standard_Image"
/usr/sbin/scutil --set LocalHostName "osximg"
```

```
#delete swapfiles
rm /private/var/vm/swapfile*
```

```
#delete volume info DB
rm /private/var/db/volinfo.database
```

```
#cleanup local admin's home dir
rm -rf /Users/admin/Desktop/*
rm -rf /Users/admin/Documents/*
rm -rf /Users/admin/Library/Caches/*
rm -rf /Users/admin/Library/Recent\ Servers/*
rm -rf /Users/admin/Library/Logs/*
rm -rf /Users/admin/Library/Keychains/*
rm -rf /Users/admin/Library/Preferences/ByHost/*
rm -f /Users/admin/Library/Preferences/com.apple.recentitems.plist
rm -rf /Users/admin/Movies/*
rm -rf /Users/admin/Music/*
rm -rf /Users/admin/Pictures/*
rm -rf /Users/admin/Public/Drop\ Box/*
```

```
#cleanup root's home dir
rm -rf /private/var/root/Desktop/*
rm -rf /private/var/root/Documents/*
rm -rf /private/var/root/Downloads/*
rm -rf /private/var/root/Library/Caches/*
rm -rf /private/var/root/Library/Recent\ Servers/*
rm -rf /private/var/root/Library/Logs/*
rm -rf /private/var/root/Library/Keychains/*
rm -rf /private/var/root/Library/Preferences/ByHost/*
rm -f /private/var/root/Library/Preferences/com.apple.recentitems.plist
rm -rf /private/var/root/Public/Drop\ Box/*
```

```
#clean up global caches and temp data
rm -rf /Library/Caches/*
rm -rf /System/Library/Caches/*
rm -rf /Users/Shared/*
rm -f /private/etc/ssh_host*
```

```
#network interfaces - this is regenerated on reboot and can differ on different hardware
rm /Library/Preferences/SystemConfiguration/NetworkInterfaces.plist
```

```
#Leopard - cleanup local KDC, see http://support.apple.com/kb/TS1245
/usr/sbin/systemkeychain -k /Library/Keychains/System.keychain -C -f
rm -rf /var/db/krb5kdc
/usr/bin/defaults delete /System/Library/LaunchDaemons/com.apple.configureLocalKDC Disabled

rm /private/var/log/wtmp.*
```

And
There's
More!

<http://managingosx.wordpress.com/2009/01/23/image-cleanup-script/>

The Solution

- ▶ Computers are good at repetition, let it do that
- ▶ The solution is to create a script to do this for you

<http://www.afp548.com/article.php?story=instadmng>

- ▶ Started by Josh Wisenbaker of AFP548.com
- ▶ I took over in July '08 (1.2b)

InstaDMG

Generate Clean Images

- ▶ A command line script - written in bash
- ▶ Produces a never-booted, clean image
 - ▶ No trash, no downloaded items, no LKDC, etc...
- ▶ Run twice in a row the image will be nearly identical
- ▶ Almost anything that can be put in a .pkg can be used
- ▶ Most packages just work (ie. MS Office)

InstaDMG

Generate Clean Images

- ▶ Creates a 300GB sparse disk image
- ▶ Installs MacOS X and provided .pkg's onto the .dmg
- ▶ ASR scans the image for quick restore

InstaDMG

InstaDMG

Generate Clean Images

- ▶ Creates a 300GB sparse disk image
- ▶ Installs MacOS X and provided .pkg's onto the .dmg
- ▶ ASR scans the image for quick restore

InstaDMG

InstaDMG

Generate Clean Images

Generate Clean Images

InstaDMG

InstallerFiles

BaseOS

BaseUpdates

CustomPKG

OutputFiles

Combo Updater

InstaDMG

Generate Clean Images

- ▶ The bad:
 - ▶ Command line script (scary)
 - ▶ Snow Leopard not working well (turn off chroot jail)
 - ▶ Some packages just don't work (distribution scripts)
 - ▶ When it goes wrong, it just keeps going (bad)
 - ▶ By itself a folder is dedicated to one image

InstaDMG

InstaUp2Date

- ▶ Included with InstaDMG
- ▶ Takes control of the source folders
- ▶ Uses “catalog” files to fill them with links to your items
- ▶ Allows multiple “build trains”
- ▶ Catalogs can reference files via http (will be cached)
- ▶ Catalogs can nest other catalog files
- ▶ Makes multiple variations of a image easy

InstaDMG

Summary of a run

- ▶ To setup for an InstaDMG/InstaUp2Date run:
 - ▶ Get the latest version (rev. 212 or better)
 - ▶ Create a DMG of a retail 10.6 disk with default name:
“Mac OS X Install Disc 1” or “Mac OS X Install DVD”
 - ▶ Create the following catalog file (10.6_vanilla):

Output Volume Name = Macintosh HD

Output File Name = 10.6.1 Vanilla

OS Updates:

MacOS X 10.6.1 Update http://supportdownload.apple.com/download.info.apple.com/Apple_Support_Area/Apple_Software_Updates/Mac_OS_X/downloads/061-7124.20090910.6oxdt/MacOSXUpd10.6.1.dmg
sha1:2e20c303e0078a488702172d782cb1b882eef543

Apple Updates:

iTunes 9 <http://appldnld.apple.com.edgesuite.net/content.info.apple.com/iTunes9/061-6350.20090909.tnzs2/iTunes9.dmg>
sha1:eb436fbe738bfa9682805d7ea76bd03c72736e89

InstaDMG

Summary of a run

`./instaUp2Date.py -p 10.6_vanilla`

1. InstaUp2Date looks for the needed files and links them
2. InstaDMG is run and looks for the installer DVD image
3. Checks to see if there is already a base install cache
4. If so mounts it, if not creates a new base image
5. Adds the packages found in the folders by order
6. Cleans up, and makes the ASR image

InstaDMG

Tips and Tricks

- ▶ Completely I/O limited - get RAID, but not XSan
- ▶ Learn to love creating packages, they are your friend
- ▶ Get on the forums, watch the developer list
- ▶ installerchoices.xml files can modify what is installed
- ▶ Use the included CreateUser package to create users
- ▶ Bypass first run: “/private/var/db/.AppleSetupDone”

InstaDMG

Future directions

- ▶ Has been on hiatus - intend to get back into it
- ▶ 2.0
 - ▶ Move to Python
 - ▶ Integrate InstaUp2Date
 - ▶ Checkpoints
 - ▶ 10.6 chroot and sandbox
- ▶ Look at sharing common configs with Munki
 - ▶ <http://code.google.com/p/munki/>

System Image Utility

Snow Leopard edition

- ▶ “NetRestore”
 - ▶ Accepts either Installer Disk or a Golden Master
 - ▶ Installer Disk route works like InstaDMG
- ▶ Create a NetBoot image
 - ▶ Console user chooses the base image from list
 - ▶ Can be allowed to type one in, or select from broadcast sources
 - ▶ This does not allow for more workflow

System Image Utility

Snow Leopard edition

- ▶ My take on it:
 - ▶ The BYO image NetBoot is really nice, but lacks a workflow
 - ▶ InstaDMG-like setting not yet ready, and I don't know when it will be

JAMF Casper

Imaging Suite

- ▶ New product from JAMF, separated from Casper
- ▶ Is able to create ASR's in InstaDMG-like fashion
 - ... or so they tell me.... Compiled Configurations

Create Package Demo

Q & A

Imaging MacOS X
